Recap: Filters & Histograms

Image filtering

Filtered images (aka feature maps)

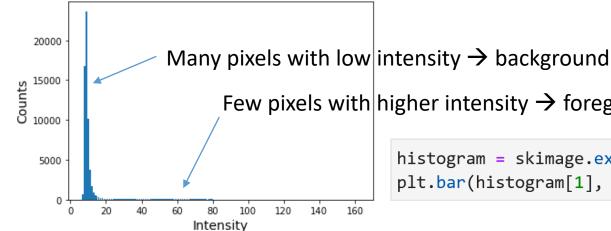

from skimage import filters, feature

https://scikit-image.org/docs/stable/api/skimage.filters.html https://scikit-image.org/docs/stable/api/skimage.feature.html

Histograms

Count number of pixels within specific ranges ("bins") of intensity

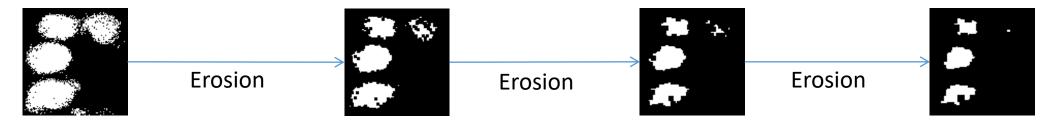

Few pixels with higher intensity → foreground

histogram = skimage.exposure.histogram(image) plt.bar(histogram[1], histogram[0])

Recap: Filters on binary images

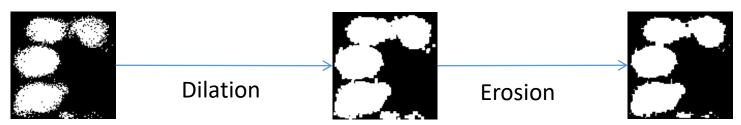

Erosion: Set all pixels to black which have at least one black neighbor.

Dilation: Set all pixels to white which have at least one white neighbor.

• Closing: Dilation + Erosion

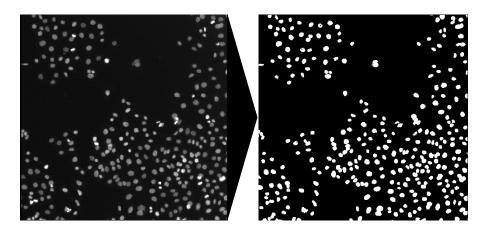

Opening: Erosion + Dilation

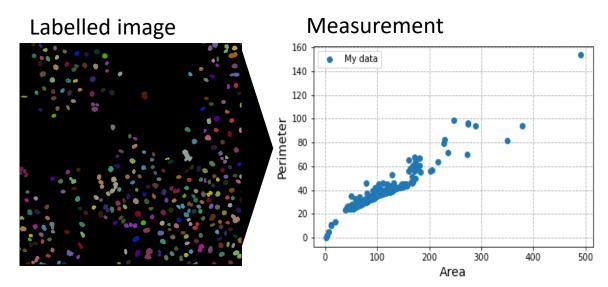

Today's content:

Complete workflow from raw images toward extracting quantitative features from image data

- Creating binary masks from intensity images (Segmentation)
 - → Thresholding
- Create label images from binary masks
 - → Connected-component analysis
- Measure features from label images
 - → Shape, Intensity, etc.
 - → Visualize measured features

Segmentation

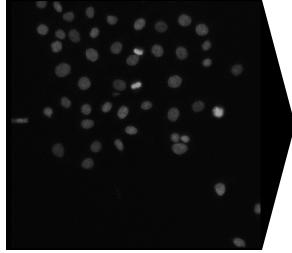

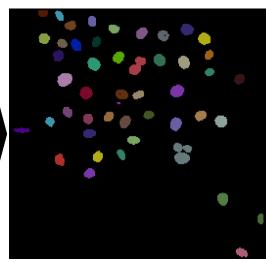

Aim:

Separate background from foreground

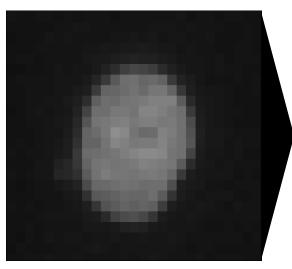

Vocabulary:

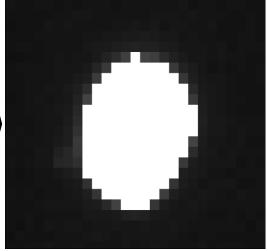

- **Segmentation:**Assigning a meaningful *label* to each pixel
- **Semantic segmentation:**Differentiate pixels into multiple *classes* (e.g., membrane, nucleus, cytosol, etc.)
- Instance segmentation:
 Differentiate multiple occurrences of the same class into separate instances of this class (e.g., separate label for each cell in image)

Instance segmentation

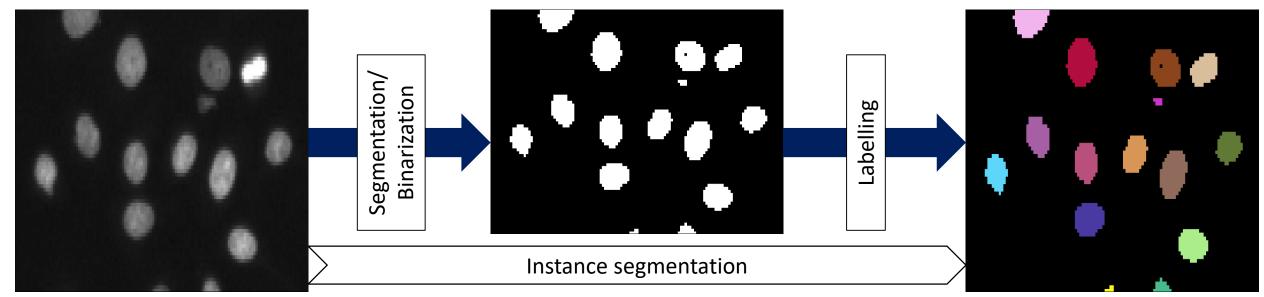

Semantic segmentation

Segmentation and labelling

Analyzing properties (features) of individual objects in images requires instance segmentation

- Methods
 - Thresholding + connected components labeling
 - Spot detection + seeded watershed
 - Edge detection based
 - Machine learning

Thresholding in Python

- Applying a threshold to an image requires to compare every pixel to the threshold value
- We can compare values in Python with:

```
image > threshold

b = 6
print(a > b)
print(a < b)
print(a == b)

false

True
False
F
```

In this case, "image" is a numpy array \rightarrow some operations are automatically applied to every pixel!

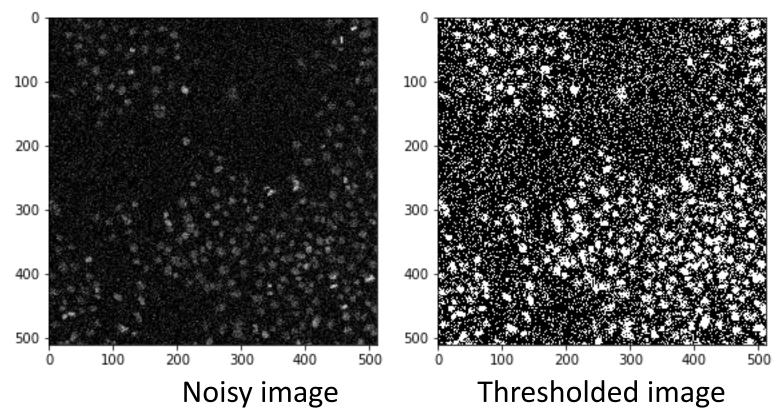

• We can then simply store the output of this element-wise comparison in a new variable:

```
binary = image > threshold
```

Reminder: pre-processing!

- Before we can create masks, we need to pre-process images.
 - Noise removal
 - Background subtraction

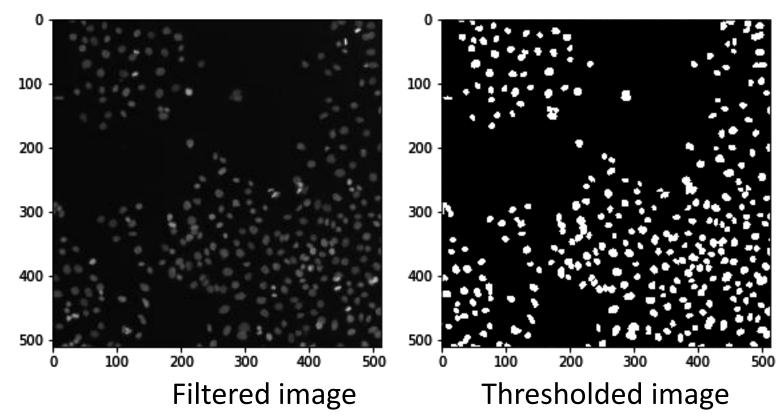

filtered = filters.median(image)

Image filtering *filters* relevant information for subsequent operations from the image!

Reminder: pre-processing!

- Before we can create masks, we need to pre-process images.
 - Noise removal
 - Background subtraction

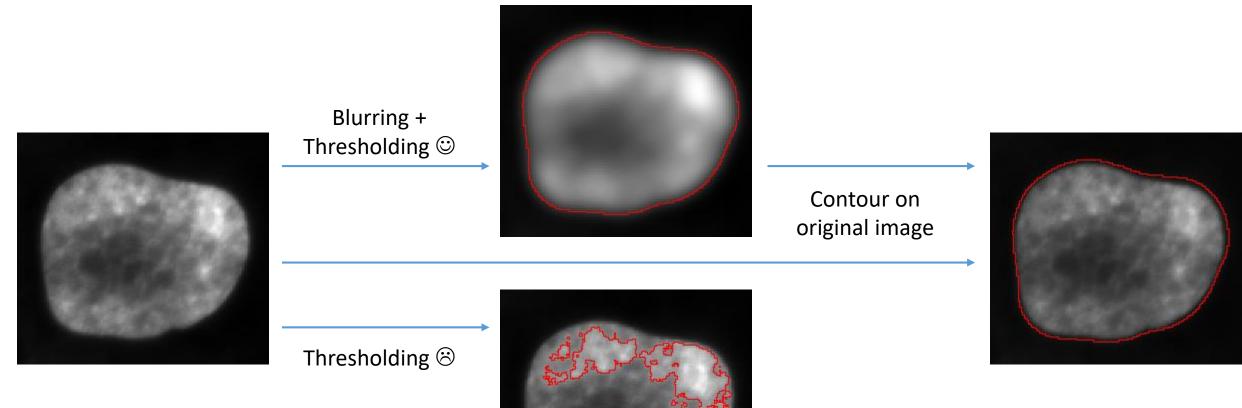

filtered = filters.median(image)

Image filtering *filters* relevant information for subsequent operations from the image!

Low-pass filtering to improve thresholding results

- In case thresholding algorithms outline the wrong structure, <u>blurring in advance</u> may help.
- However: **Do not** continue processing the blurred image, continue with the original!

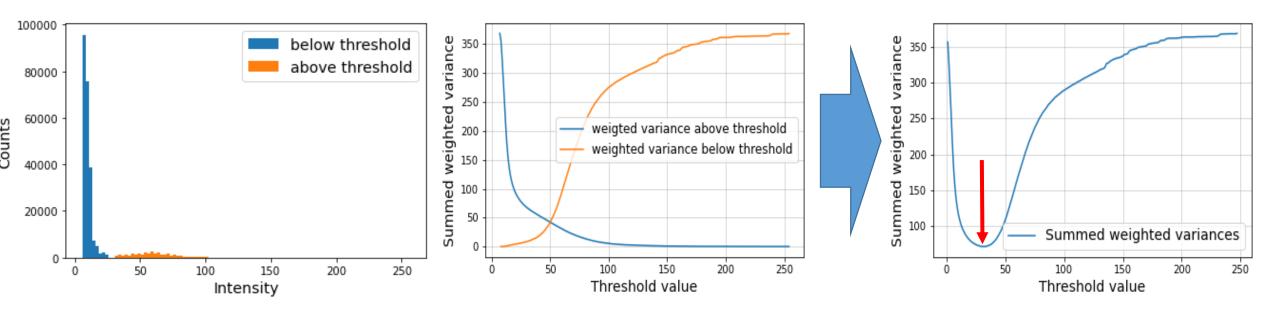

Threshold algorithms

• Otsu-thresholding (Otsu et Al. 1979): Find threshold so that the summed, weighted variance $Var_{w,sum}$ becomes minimal:

$$Var(I) = \frac{1}{n_I} \sum \left(I - mean(I) \right)^2 \qquad \Rightarrow \qquad Var_{w,sum} = \frac{n_A}{n_I} \cdot Var(A) + \frac{n_B}{n_I} \cdot Var(B)$$

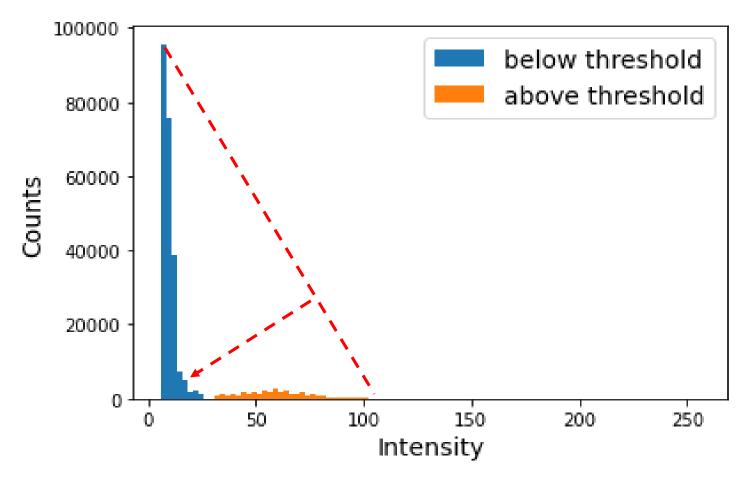

• Statistical thresholding: Pixels above statistical parameter of I belong to foreground. (Possibilities: Mean, Median, Quartiles, etc.)

Threshold algorithms

• **Triangle thresholding**: Draw a line between histogram point with max. counts and max. intensity and find point in histogram with maximal distance to this line (----)

Thresholding with scikit-image

```
threshold = filters.threshold_otsu(image)
```

• Otsu-thresholding (Otsu et Al. 1979): Find threshold so that the summed, weighted variance $Var_{w,sum}$ becomes minimal.

```
threshold = filters.threshold_mean(image)
```

• Statistical thresholding: Pixels above statistical parameter of I belong to foreground. (Possibilities: Mean, Median, Quartiles, etc.)

```
threshold = filters.threshold_triangle(image)
```

 Triangle thresholding: Draw a line between histogram point with max. counts and max. intensity and find point in histogram with maximal distance to this line.

Cite the thresholding method of your choice properly

We segmented the cell nuclei in the images using the Otsu thresholding method (Otsu et Al. 1979) implemented in scikit-image (van der Walt et Al. 2014).

IEEE TRANSACTIONS ON SYSTEMS, MAN, AND CYBERNETICS, VOL. SMC-9, NO. 1, JANUARY 1979

A Threshold Selection Method from Gray-Level Histograms

NOBUYUKI OTSU

Abstract—A nonparametric and unsupervised method of automatic threshold selection for picture segmentation is presented. An optimal threshold is selected by the discriminant criterion, namely, so as to maximize the separability of the resultant classes in gray

Thresholding: Pitfalls

Inter-observer

variability

```
binary = image > a_good_threshold_value_of_my_choice
```

Never use manual thresholding!

- > Different observers come to different results when selecting a "good" threshold value
- > You may come to different results when selecting a threshold value repeatedly

```
binary = image > threshold
intensities = some_function_to_measure_intensities(binary, image)
```

Intra-observer variability

Avoid thresholding an image and afterwards measure intensities in the same image

You would measure the threshold you entered

```
binary_1 = image_1 > threshold_1(image_1)
binary_2 = image_2 > threshold_2(image_2)
```

Chose one threshold algorithm:

...and stick to it for the whole study. Using a new method for every image impairs reproducibility!

Do not over-engineer

There will be always images where thresholding fails – better report the errors!

Refining masks

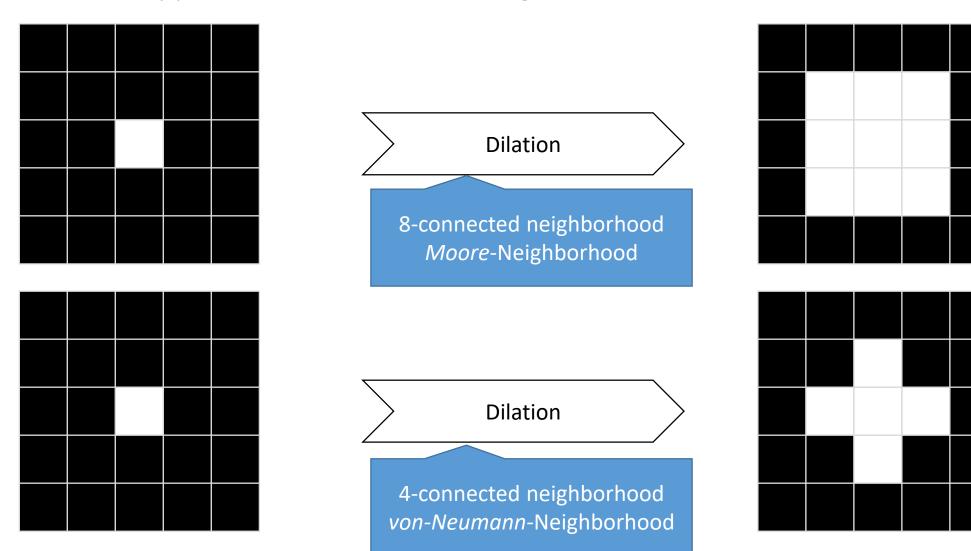

• Binary mask images may not be perfect immediately after thresholding.

 There are ways of refining them 10 -20 50 -30 -Small debris 40 -100 -100 20 150 -150 200 -200 10 250 250 50 100 200 250 150 150 Holes ■

Refining masks: Dilation

Dilation: Every pixel with at least one white neighbor becomes white.

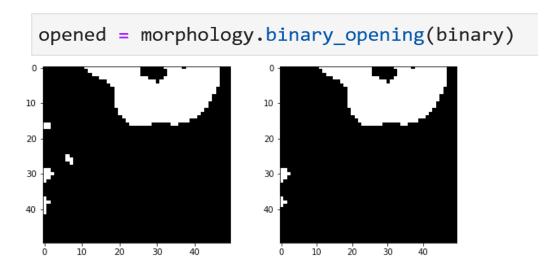

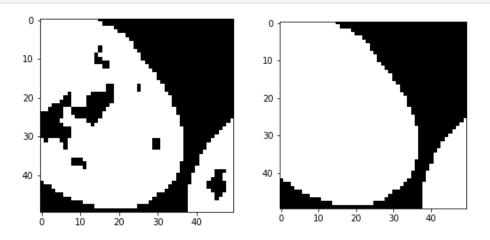

Refining masks: Opening & Closing

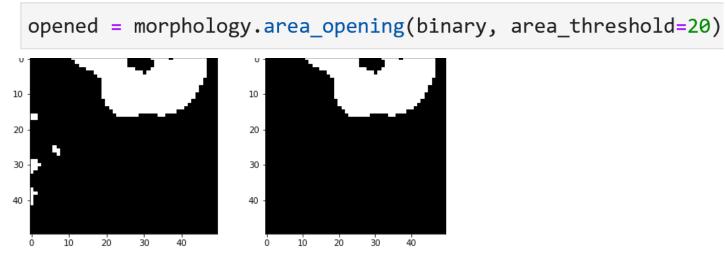

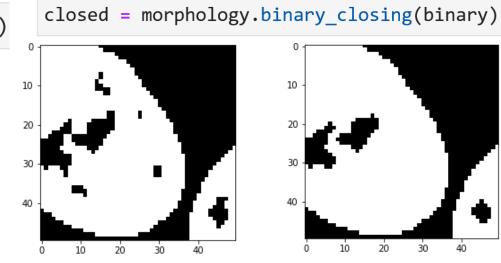

from skimage import morphology

closed = morphology.area_closing(binary, area_threshold=100)

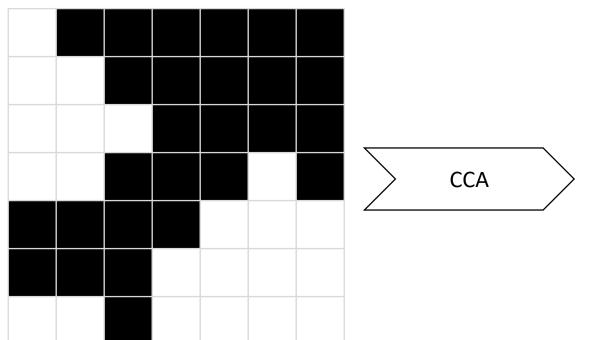

Connected components labelling

- In order to allow the computer differentiating objects, connected components analysis (CCA) is used to mark pixels belonging to different objects with different numbers
- Background pixels are marked with 0.
- The maximum intensity of a labelled map corresponds to the number of objects.

1	0	0	0	0	0	0
1	1	0	0	0	0	0
1	1	1	0	0	0	0
1	1	0	0	0	3	0
0	0	0	0	3	3	3
0	0	0	3	3	3	3
2	2	0	3	3	3	3

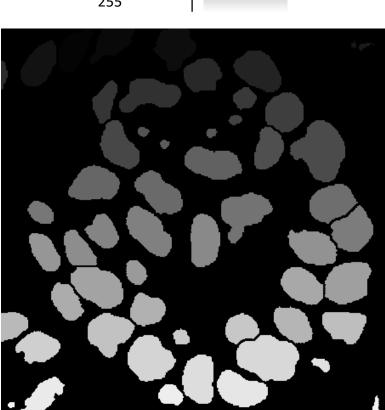

Label map visualisation

• Label maps can be nicely visualized with the right lookup table

Feature extraction

- Feature extraction is a late processing step in image analysis.
- It can be used for images, or segmented/labelled images

Feature extraction

- A feature is a countable or measurable property of an image or object.
- Goal of feature extraction is finding a minimal set of features to describe an object well enough to differentiate it from other objects.
- Intensity based
 - Mean intensity
 - Standard deviation
 - Total intensity
 - Textures

- Shape based /spatial
 - Area / Volume
 - Roundness
 - Solidity
 - Circularity / Sphericity
 - Elongation
 - Centroid
 - Bounding box

- Spatio-temporal
 - Displacement,
 - Speed,
 - Acceleration

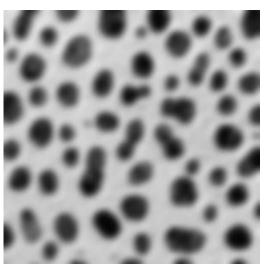

- Others
 - Overlap
 - Colocalization
 - Neighborhood

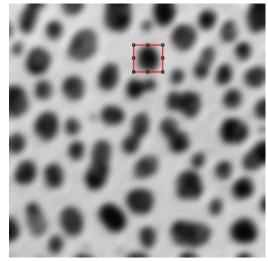

- Mixed features
 - Center of mass
 - Local minima / maxima

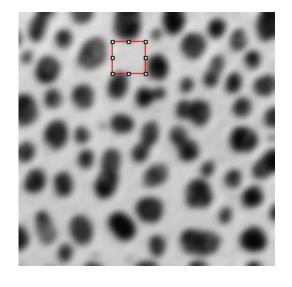

Intensity based features

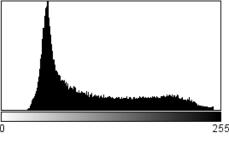

- Min / max
- Median
- Mean
- Mode
- Variance
- Standard deviation
- Can be derived from pixel values
- Don't take spatial relationship of pixels into account
- See also:
 - descriptive statistics
 - histogram

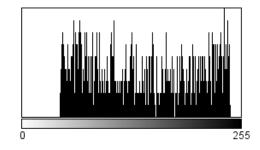

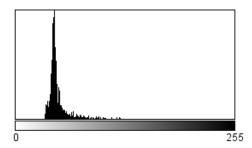

Count: 65024 Mean: 103.301 StdDev: 57.991 Min: 29 Max: 248 Mode: 53 (1663)

Count: 783 Mean: 141.308 StdDev: 61.876 Min: 44 Max: 243 Mode: 236 (9)

Count: 1056 Mean: 49.016 StdDev: 12.685 Min: 34 Max: 122 Mode: 45 (120)

Bounding rectangle / bounding box

- Position and size of the smallest rectangle containing all pixels of an object
 - x_b , y_b ... position of the bounding box
 - w_h ... width of the bounding box
 - h_b ... height of the bounding box

variable	value
x_b	0
y_b	2
w_b	3
h _b	2

	0	1	2	3	4 X
0	0	0	0	0	0
1	0	0	0	0	0
2	1	1	1	0	0
3	0	1	1	0	0
4 y	0	0	0	0	0

Center of mass

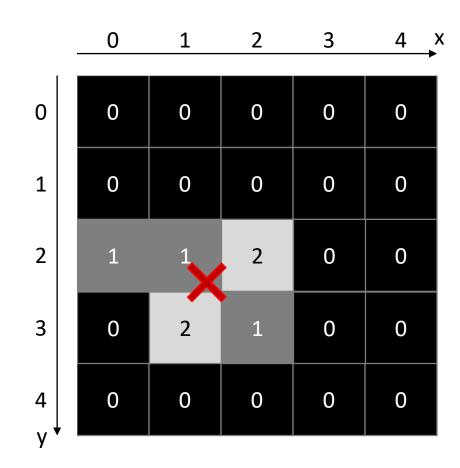

- Relative position in an image weighted by pixel intensities
 - x, y ... pixel coordinates
 - w ... image width
 - h ... image height
 - μ ... mean intensity
 - g_{x,y} ... pixel grey value
 - x_m , y_m ... center of mass coordinates

$$\mu = \frac{1}{wh} \sum_{v=0}^{h-1} \sum_{x=0}^{w-1} g_{x,y}$$

$$x_m = \frac{1}{wh\mu} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} x \ g_{x,y}$$

$$y_m = \sum_{wh\mu} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} y \ g_{x,y}$$

"sum intensity"
"total intensity"

$$x_m = 1/7 (1.0 + 1.1 + 2.2 + 2.1 + 1.2) = 1.3$$

$$y_m = 1/7 (1.2 + 1.2 + 2.3 + 2.2 + 1.3) = 2.4$$

Center of geometry / centroid

- Relative position in an image weighted by pixel intensities
- Special case of center of mass for binary images
 - x, y ... pixel coordinates
 - w ... image width
 - h ... image height
 - μ ... mean intensity
 - $g_{x,v}$... pixel grey value, integer in range [0;1]
 - x_m , y_m ... center of mass coordinates

$$\mu = \frac{1}{wh} \sum_{v=0}^{h-1} \sum_{x=0}^{w-1} g_{x,y}$$

$$x_m = \frac{1}{wh\mu} \sum_{v=0}^{h-1} \sum_{x=0}^{w-1} x \ g_{x,y}$$

$$y_m = \sum_{wh\mu} \sum_{y=0}^{h-1} \sum_{x=0}^{w-1} y \, g_{x,y}$$

Number of white pixels

$$x_m = 1/5 (1.0 + 1.1 + 1.2 + 1.1 + 1.2) = 1.2$$

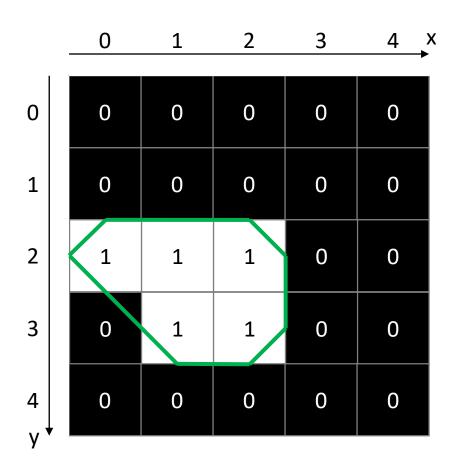

$$y_m = 1/5 (1\cdot 2 + 1\cdot 2 + 1\cdot 3 + 1\cdot 2 + 1\cdot 3) = 2.4$$

Perimeter

- Length of the outline around an object
- Depends on the actual implementation

	0	1	2	3	4 X
0	0	0	0	0	0
1	0	0	0	0	0
2	1	1	1	0	0
3	0	1	1	0	0
4	0	0	0	0	0
y 🕇					

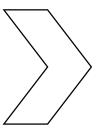

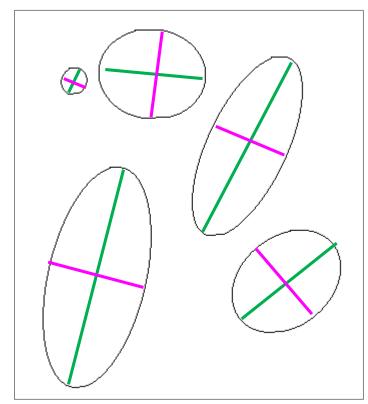

Fit ellipse

- For every object, find the optimal ellipse simplifying the object.
- Major axis ... long diameter
- Minor axis ... short diameter
- Major and minor axis are perpendicular to each other

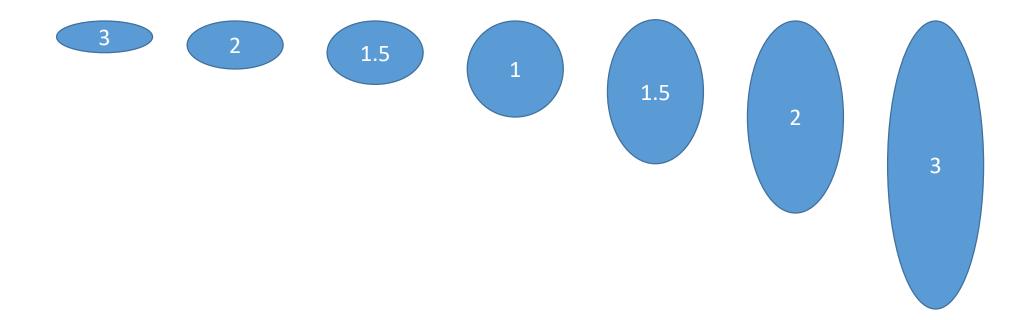

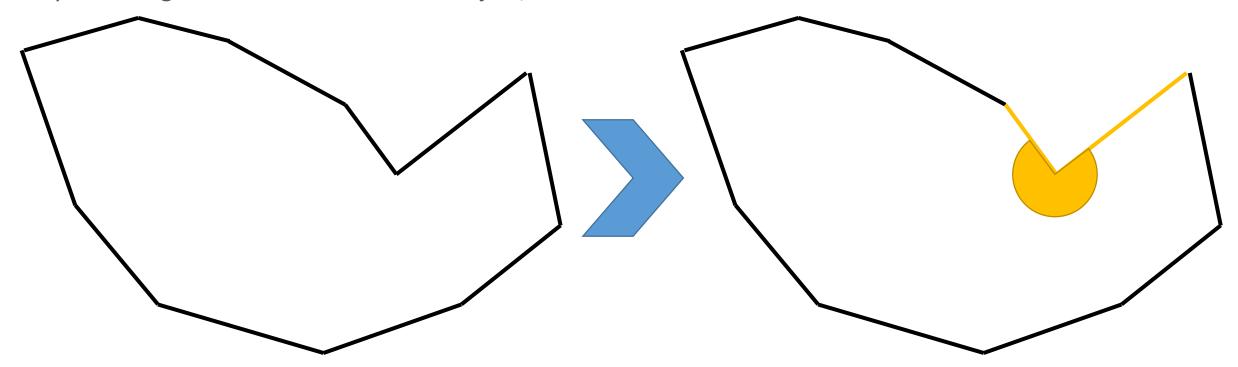

• The aspect ratio describes the elongation of an object.

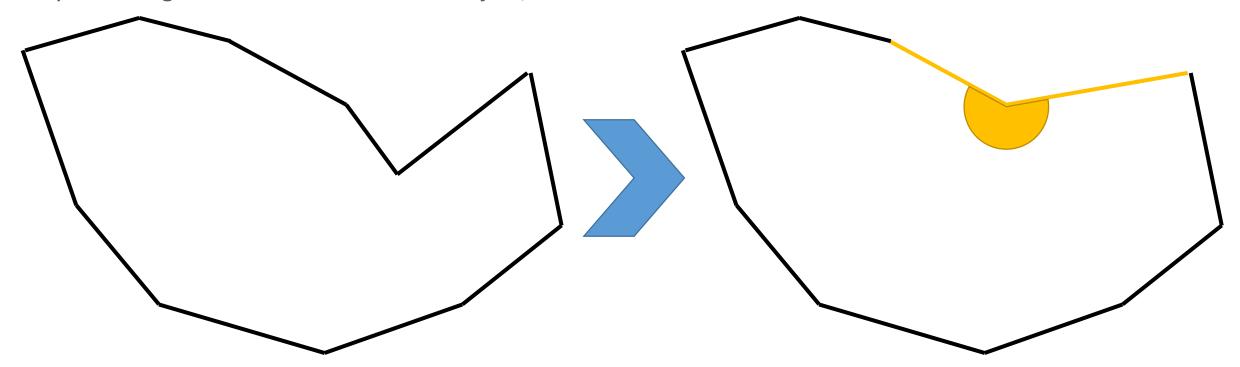

AR = major / minor

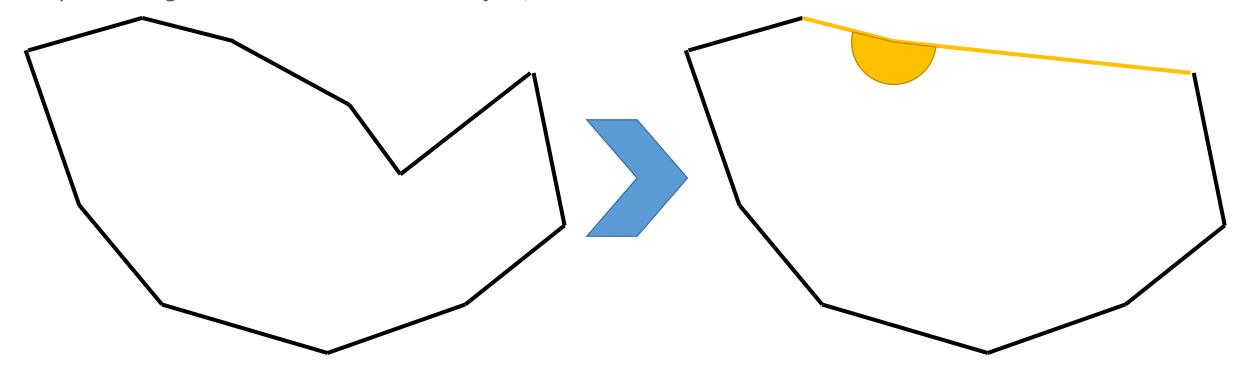

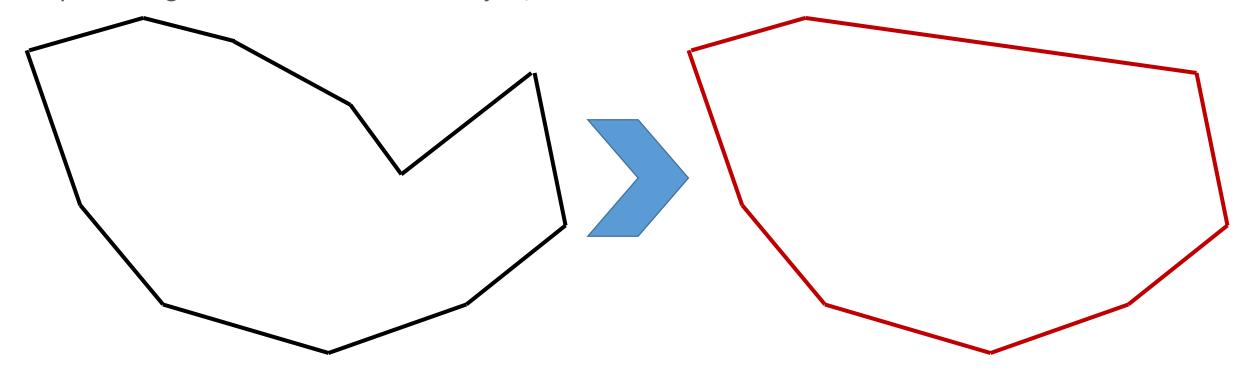

$$solidity = \frac{A}{A_{convexHull}}$$

Roundness and circularity

Pol Physics of Life TU Dresden

- The definition of a circle leads us to measurements of circularity and roundness.
- In case you use these measures, define them correctly. They are not standardized!

Diameter

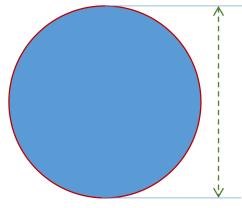

d

Circumference

 $C = \pi d$

Area

$$A = \frac{\pi d^2}{4}$$

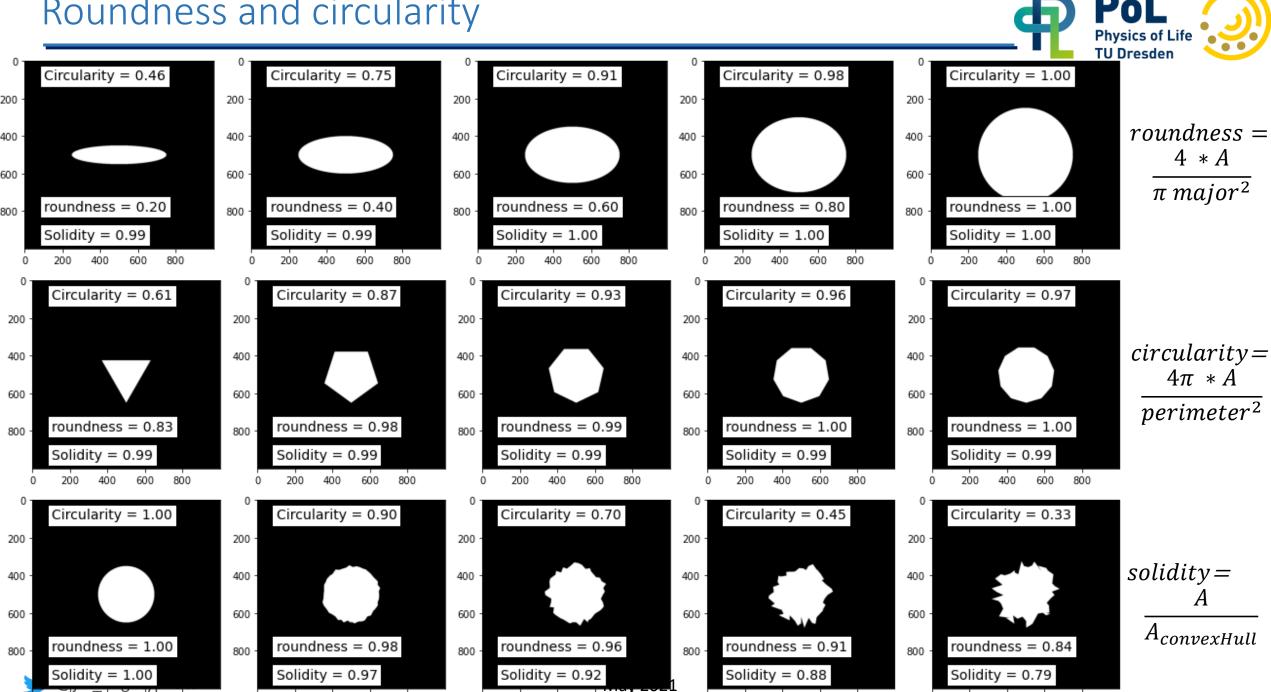

$$roundness = \frac{4 * A}{\pi \ major^2}$$

$$circularity = \frac{4\pi * A}{perimeter^2}$$

Roundness = 1 Circularity = 1 Roundness ≈ 1 Circularity ≈ 1 Roundness < 1 Circularity < 1

Roundness and circularity

200 400 500 000

Feature extraction in Python

- In Fiji: Analyze > Analyze Particles...
- In Python: from skimage import measure

https://scikit-image.org/docs/stable/api/skimage.measure.html

<pre>skimage.measure.blur_effect (image[, h_size,])</pre>	Compute a metric that indicates the strength of blur in an image (0 for no blur, 1 for maximal blur).
skimage.measure.euler_number (image[,])	Calculate the Euler characteristic in binary image.
<pre>skimage.measure.find_contours (image[,])</pre>	Find iso-valued contours in a 2D array for a given level value.
<pre>skimage.measure.grid_points_in_poly (shape, verts)</pre>	Test whether points on a specified grid are inside a polygon.
<pre>skimage.measure.inertia_tensor (image[, mu])</pre>	Compute the inertia tensor of the input image.
skimage.measure.inertia_tensor_eigvals (image)	Compute the eigenvalues of the inertia tensor of the image.
skimage.measure.label (label_image[,])	Label connected regions of an integer array.
skimage.measure.regionprops (label_image[,])	Measure properties of labeled image regions.
skimage.measure.regionprops_table (label_image)	Compute image properties and return them as a pandas-compatible
	table.

area : int

Number of pixels of the region.

area_bbox : int

Number of pixels of bounding box.

area_convex : int

Number of pixels of convex hull image, which is the smallest convex polygon that of

area_filled : int

Number of pixels of the region will all the holes filled in. Describes the area of the i

axis_major_length : float

The length of the major axis of the ellipse that has the same normalized second ce the region.

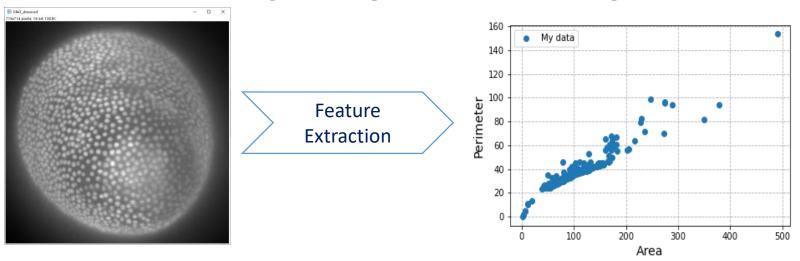

axis_minor_length : float

The length of the minor axis of the ellipse that has the same normalized second ce the region.

Feature extraction

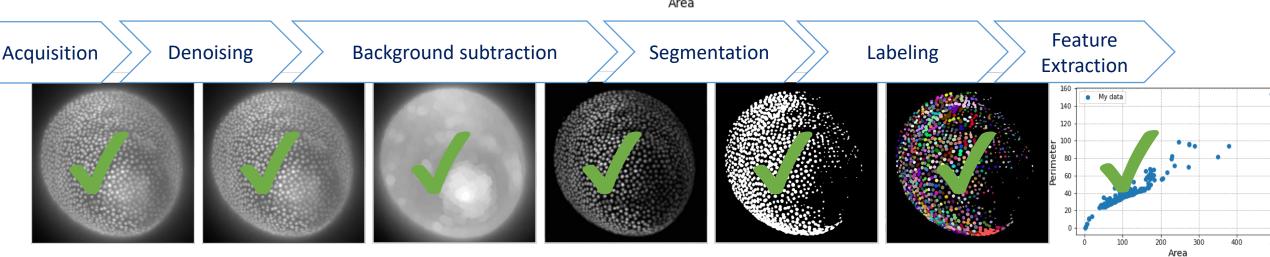

- Feature extraction is a late processing step in image analysis.
- It can be used for images, or segmented/labelled images

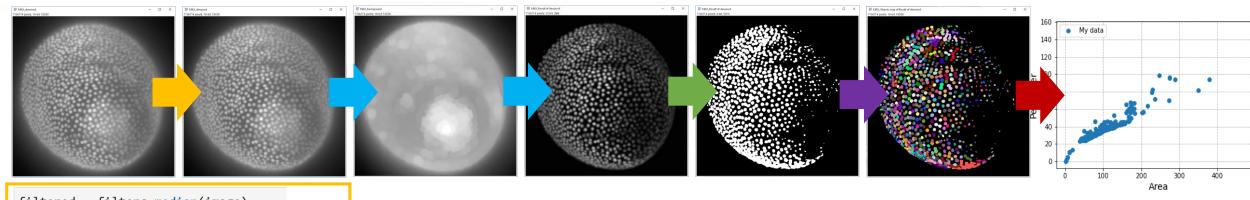

filtered = filters.median(image)

filtered = filters.gaussian(image, sigma=5)

Summary

filtered = filters.median(image)

filtered = filters.gaussian(image, sigma=5)

Filtering the image reduces pixel noise

bg_subtracted = morphology.white_tophat(image, footprint=footprint)

Top-hat filtering removes the background

Thresholding binarizes the image

threshold = filters.threshold_otsu(image)

Connected-components analysis groups pixels to objects

labels = measure.label(binary)

Feature extraction allows descriptive statistics

measurements = measure.regionprops_table(labels, properties=properties)
